What's a little plutonium between friends?

The issue appears to be no more than what type of energy to develop. The problem, however, is not one of "methods" or "techniques." Rather, what should be questioned is who owns and controls the technology, who commands the use of our lives, and especially, how long will we let this situation continue. The use of nuclear power demonstrates there are no longer any local or partial solutions.

The power is in your hands.

Nuclear destruction is no inevitable product of technological development. Thus far we have seen science used primarily for the production of profit. It must become evident that science and technology cannot change unless we transform the whole of our society. We can no longer "correct" or simply "criticize" capitalism. The moment has come to move beyond it.
